

# The Universal Shooting Rest

---

## Adaptability

The **SABRE** Ballistics Shooting Rest accepts any handgun, pistol or revolver and any rifle or sub-machine gun (with or without folding stock) by using moulded butt pockets. The weapon mounting points are fully adjustable for length and height on a rigid base plate to accept any configuration of weapon.

## Accuracy

The rigid clamping of the weapon combined with the adjustable hydraulic in line recoil buffering and recuperation ensures bench rest accuracy.

## Precision

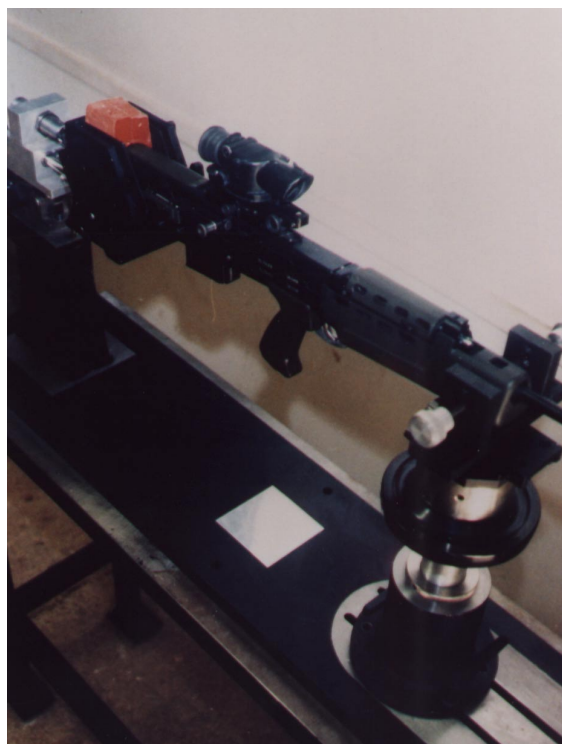

The rest incorporates precise elevation and azimuth adjustment for both rifles and pistols to aid setting and to ensure repeatable results.

## Safety

The rest rigidly clamps the weapon whilst allowing controlled recoil to take place. Confident automatic firing is assured without re-aiming. Safe remote firing is available with the use of the easily fitted remote cable trigger pull actuated by a solenoid allowing safety links and interlocks to be incorporated into the system.

Overall, the system gives flexibility in mounting any weapon with its modular design, from a small pistol to a full length rifle. Alternative build standards to customer specification are also available.

Safety, accuracy, precision and adaptability are automatic with this unique system, designed and developed by professional weapon engineers.
