

Copper Crusher (Kistler Compatible)

In small / medium calibre ammunition tests where copper crusher breech pressure measurements are still required, this Kistler 6215 compatible crusher gauge holder allows an easy upgrade path to piezo-electric measurements without major barrel re-working.

The Gauge holder is fitted in a standard Kistler NATO approved transducer pressure port tapping. It uses the normal front face seal from Kistler.

For Organisations still using copper crushers for small / medium calibre measurements, these Gauge holders allow an easy transition to piezoelectric pressure measurements. No barrel re-working is required and comparison between copper and piezo-electric measurements are easily accomplished.

Several piston sizes are available to suit different pressure ranges. SABRE will be pleased to discuss particular needs.
