

Reloading Equipment

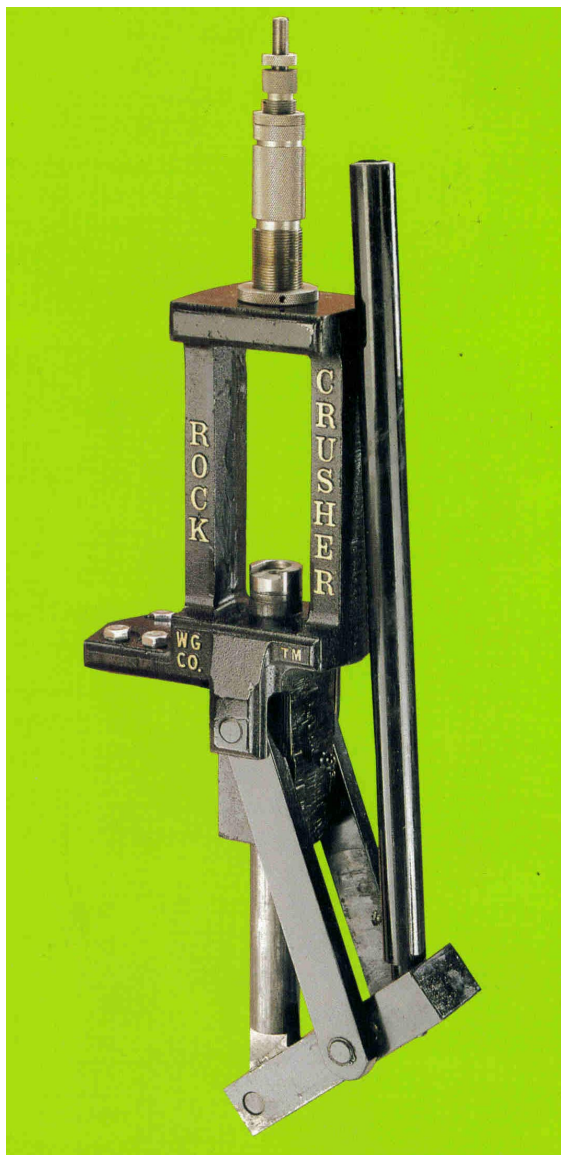

It is commonly necessary to unload and reload ammunition for armour testing applications. This is normally to adjust the projectile velocity.

SABRE Ballistics provides complete kits of equipment to perform manual unloading / reloading. SABRE also supplies power driven bullet extraction equipment, which is described in other datasheets.

The reloading kits are configured to suit the Customer's particular needs and calibres. Typical kits include:

- A Reloading Press (single or multi-stage)
- Die sets for each calibre
- Shell holders for each calibre
- Manual bullet extractor
- Powder scales
- Powder "Trickler" and funnel
- Hand priming tool
- Case trimming tool

The kits use high quality parts from a selection of manufacturers to obtain the best solution for each calibre range.

These pictures show a larger calibre reloading press that can be used for calibres up to at least 20mm. Smaller presses can be multi-stage.

We reserve the right to amend these specifications without further notice.
